Write a method padString that accepts two parameters: a String and an integer representing a length. The method should pad the parameter string with spaces until its length is the given length. For example, padString("hello", 8) should return " hello". (This sort of method is useful when trying to print output that lines up horizontally.)

### padString - Solve a Problem - Practice-It

Suppose that a class Point2D has been defined for storing a 2-dimensional point with x and y coordinates (both as doubles).(In our section handout, the class was called Point, but we have renamed it here because Practice-It uses a class named Point for other purposes.) The class includes the following members:

### ComparablePoint - Solve a Problem - Practice-It

Write a method minToFront that takes an ArrayList of integers as a parameter and that moves the minimum value in the list to the front, otherwise preserving the order of the elements. For example, if a variable called list stores the following values: {3, 8, 92, 4, 2, 17, 9} and you make this call: minToFront(list); it should store the following values after the call: {2, 3, 8, 92, 4, 17, 9} ...

Write a method named pow2 (a variation of the previous pow exercise) that accepts a real number base and an integer exponent as parameters and returns the base raised to the given power. Your code should work for both positive and negative exponents. For example, the call pow2(2.0, -2) returns 0.25. Do not use Math.pow in your solution.
