This paper deals with analysis of laminated composite plates for critical buckling in uniaxial and biaxial loading. The minimum load at which the equilibrium is disturbed known as the critical buckling load. The laminated composite plates are thin shell elements composed of fibre lamination and epoxy resin is used to bond the lamina.

This paper deals with the nonlinear bending analysis of laminated composite stiffened plates subjected to uniform transverse loading. The eight-noded degenerated shell element and three-noded degenerated curved beam element with five degrees of freedom per node is adopted in the present analysis to model the plate and stiffeners respectively.

Nonlinear bending analysis of laminated composite ...

The composite has a considerably higher shear stiffness to weight ratio than an equivalent beam made of only the core material or the face-sheet material. The composite also has a high tensile strength to weight ratio. The high stiffness of the face-sheet leads to a high bending stiffness to weight ratio for the composite.
