Electrical Power And Electrical Traction

This traction power can be diesel, steam or electric power. The traction system can be classified as non-electric and electric traction systems. Non-electric traction system. A traction system that

doesn't use electrical energy for the movement of vehicle at any stage is referred as non-electric traction system. The steam engine drive is the best example of a non electric traction system and it is the first locomotive system used before the invention of actual electric traction systems.

A railway electrification system supplies electric power to railway trains and trams without an on-board prime mover or local fuel supply. Electric railways use either electric locomotives, electric multiple units or both. Electricity is typically generated in large and relatively efficient generating stations, transmitted to the railway network and
