(PDF) Separators in Orthodontics: A Review

Orthodontic separators (commonly known as spacers) are rubber bands or metal appliances used in orthodontics. Spacers are placed between the molars at the second orthodontic appointment, before molar bands are applied. Spacers are either circular rubber bands about a centimeter in diameter placed between top and bottom molars.

Getting orthodontic separators - The Look Orthodontics

Orthodontic separators, sometimes called "spacers", are O shaped elastics that go in between your teeth to SEPARATE those teeth. The primary reason we would want to have a tooth separated is so we...

How To Replace an Orthodontic Separator

Separators . Many orthodontists will use bands on the back molar teeth to provide additional support and to allow for different attachments. The bands are essentially metal rings that completely surround the teeth. Since most people's teeth do not have spaces between them, it would be nearly impossible or very difficult to place bands without spaces.

Separators are used to create space between teeth. An orthodontic band is the older style of braces that are usually used in the posterior part of the mouth. An orthodontic band is a band of stainless steel metal that wraps around the tooth. It is held in place with special dental cement.

What are Separators, Spacers and Orthodontic Bands? | Ask ...

Orthodontic separators are rubber bands or metal appliances used in orthodontics. Spacers are placed between the molars at the second orthodontic appointment before molar bands are applied. They are usually added a week before you get your braces, but can sometimes be added after. Spacers are either circular rubber bands about a centimeter in diameter placed between top and bottom molars; there may be 1-12 spacers applied or small metal spring clips that push the molars apart. The spacers stay b

Orthodontic spacer - Wikipedia

Different types of separators have been used in orthodontics (eg. Brass wire, Latex elastics, Elastomers, Kesling separators, NEET separators and Maxian elastic separator etc.) Studies say that during the past few years, springs and elastomers have most often been used.

Tooth Separators - Orthodontic Supply & Equipment Company

These spacers are rubber bands that dentists will place between certain teeth. They are to remain in place for a few weeks at most, until the teeth have moved apart enough for the braces to be installed. They are generally only about a centimeter in diameter. The biggest complaint among patients who receive these orthodontic spacers is pain.
