A standard scheme for a relation between special functions and group representation theory is the following: certain classes of special functions are interpreted as matrix elements of irreducible representations of a certain Lie group, and then properties of special functions are related to (and derived from) simple well-known facts of representation theory.

Special Functions and the Theory of Group Representations ...

Special functions are particular mathematical functions that have more or less established names and notations due to their importance in mathematical analysis, functional analysis, geometry, physics, or other applications. The term is defined by consensus, and thus lacks a general formal definition, but the List of mathematical functions contains functions that are commonly accepted as special.

Special Functions and the Theory of Group Representations

The theory of special functions is connected with group representations (cf. representation theory), with methods of integral representations based on the generalization of the Rodrigues formula for classical orthogonal polynomials, and with methods in probability theory .

so that a function in n -space is more adequately represented by the pair $(f(x), g(x))$, where $g(x)$ belongs to an independent space. This is particularly useful in control theory [6]. (e) Thus, the special function, $C_0: y_0 = 0, 0 \leq x \leq 1$, is distinguished from the ordinary function $y = 0$ or the line segment AB .

Special Functions and the Generalized Integral

functions appear as solutions of boundary value problems in physics and engineering. The survey of special functions presented here is not complete - we focus only on functions which are needed in this class. We study how these functions are defined, their main properties and some applications.

Chapter 5 Special Functions

functions commonly called "special" obey symmetry properties that are best described via group theory (the mathematics of symmetry). In particular, those special functions that arise as explicit solutions of the partial differential equations of mathematical physics, such as via separation of variables, can

diate step, Sturm-Liouville theory is used to study the most common orthogonal functions needed to separate variables in Cartesian, cylindrical and spherical coordinate systems. Boundary valued problems are then studied in detail, and integral transforms are discussed, including the study of Green functions and propagators.

The summation is the real part of the Riemann zeta function, (s) , a function with many interesting properties, most of which involve its continuation into the complex plane. However, for the real part we get that $(s) = \frac{1}{s-1} + C(s)$; where $0 < C(s) < 1$. We shall return to both these examples later. 1.2. Fourier Series Let $L > 0$ and define the ...

If you read enough mathematics, you eventually come across several so-called "special functions". I'm always left wondering what on Earth these things are actually for. We have the Euler Gamma function, the Beta function, the infamous Riemann zeta function, the Airy functions, the Möbius function, the Bessel functions, the Jacobi theta functions, the digamma and polygamma functions, the polylog, the Chebyshev polynomials, Weierstrass's elliptic functions, the Dedekind eta function, the ...
